DISSERTATION ABSTRACT

My dissertation, *A Feminist Contestation of Ableist Assumptions: Implications for Biomedical Ethics, Disability Theory, and Phenomenology*, argues that the dominant ways of thinking about the body within philosophy through the lens of biological or cultural determinism are inadequate for theorizing experiences of disability because they cannot begin to capture the complexity of embodied subjectivity. The former gives too much explanatory weight to particular aspects of the body, while the latter gives too little. Both miss the negotiation between the embodied subject and her social milieu and fail to account for the role of the individual in making sense of her situation. I contend that the experiences and knowledge of disabled people must be included for epistemic practices related to disability to be just. Finally, I demonstrate how philosophical inquiry within biomedical ethics and phenomenology is radically transformed when experiences of disability are taken seriously.

In the first two chapters, I focus on epistemological and ontological concerns surrounding disability within biomedical ethics. Although disabled people and their advocates have been writing about the risks, knowledge, and experiences of disabled people have had minimal impact on discussions within biomedical ethics textbooks. The risks of making problematic assumptions about disability are high within this subfield insofar as bioethicists impact practices within medical facilities, public policy, and, through student engagement with their texts in biomedical ethics courses, the views of potential health care professionals. All of these, in turn, affect the care provided to disabled people and potential parents of disabled children. Chapter three raises ontological issues related to disability theory, examining the role of the impairment/disability distinction in framing discussions of the body as well as the status of experience. I discuss two approaches to incorporating subjective experiences of the body in disability, arguing that neither is sufficient. I examine debates within feminist theory on questions related to experience. I argue that a feminist phenomenological approach that builds on Merleau-Ponty's work provides a more adequate account of embodied experience. I conclude by arguing that disability theorists and disability theorists must take seriously the experiences of disabled people and their advocates in order to develop a more adequate account of embodied experience.
